                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      seq length: 0

No. is the number of results predicted by chance to have score greater than or equal to the score of the result being part and is derived by analysis of the total score distribution.

The composition can be used to inhibit the proliferation of cancer or virally infected cells, or induce apoptosis in cancer or virally infected cells.
          streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GZ (Streptococcus pyogenes), comprising one of 5483 sequences (31), given it the specification. The proteins har intibacterial antiinflammatory activity (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by

                       The invention relates to isolated polynucleotides (ABZ72147-ABZ42522) of a Streptococcus pneumoniae genomic sequence, a fragment or degenerate variant of the polynucleotide or a nucleic acid sequence 95% identical to one of the polynucleotides. The S. pneumoniae polynucleotides and encoded polypeptides (ABP81299-ABP81674) are useful for treating or preventing S. pneumoniae infections or non-systemic diseases, e.g. otitis media, which are induced or exacerbated by S. pneumoniae. These are also useful for detecting S. pneumoniae in a biological sample or diagnosing S. pneumoniae infection in a subject. The polynucleotides have antibacterial activity and are useful in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to determine whether a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity

                              CC Streptococcus pneumoniae type 4 strain genomic sequence appearing as CC ABS56454. Also included are an antibody which binds one of the proteins, treating a patient by administering first and second primers, CC which are the nucleic acid cited above or fragments between nucleotides GC 8-100 of a sequence not defined in the specification, for amplifying a CC target sequence contained within a Streptococcus nucleic acid sequence. CC where the first primer is substantially complementary to the target sequence and the second primer is substantially complementary to the complement of the target sequence, and where the parts of the primers GC having substantial complementarity define the termini of the target sequence to be amplified, assay comprising contacting a test compound CC with the protein, and determining whether the test compound binds to the protein, and determining whether the test compound binds to the contest and a Streptococcus pneumoniae bacterium, where one or more genes encoding the proteins has been rendered inactive. The proteins, cc medicaments for treating or preventing a disease or infection due to streptococcus bacteria, particularly S. pneumoniae, such as pneumonia, sepsis, othis media or ear infection. They are also useful in developing of identifiers, and antibiotics. The methods are useful for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 11; SEQ ID NO 2998; 1297pp + Sequence Listing; English.

                                                                                                                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more gennes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLJ6176-ABLJ611), expressed DNA sequences (ABLJ6175) and the encoded proteins
                                                                                                                                                                                                                                                                       New isolated nucleic acid genes from Drosophila and interactions -

                                                                                                                                                                                                                                                                                                                                               The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are
                                                                        Arabidopsis thaliana protein
                                                                                                                          ABP81234;
                                                                                                                                                 ABP81234 standard;
                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Tietjen K, Weidler

The invention specifically relates to a method to identify an expression product that is modulated by PTGS. The polynucleotide is useful for modulating the gene expression within a cell by PTGS, by introducing the polynucleic acid into a cell and expressing the nucleic acid segment in the cell to form a product. The polynucleic acid segment is also useful for augmenting a cell genome, and for augmenting a plant genome, by contacting a plant cell with the segment to produce a transformed plant cell, and growing the transformed plant cell to produce a differentiated transformed plant. The sequences shown in ABBB1173 - ABBB1298 represent the product of a segment of A. thaliana cDNA modulated by PTGS.

The present invention describes human ATP-binding cassette transporters (CC (ABC). Specifically described are the human ABCA5, ABCA6, ABCA9 and ABCA10 genes (see ABN9594 to ABN9597) which encode the proteins given can ABB81574 to ABB81577). ABN89599 to ABN89715 represent ABCA5, ABCA6, CC ABCA10 genes (see ABN89597). ABN89715 represent ABCA5, ABCA6, ABCA9 and ABCA10 nucleotide fragments; and ABN89716 to ABN89806 represent comparison of the present invention. The ABC sequences have careful for ABCA5, ABCA9 and ABCA10 genes which are used in the case the present invention. The ABC sequences have comparison of the present invention. The ABC sequences have can be used in the manufacture of a medicament intended for the prevention and/or treatment of a subject affected by a dysfunction in the reverse transport of cholesterol. The ABC proteins are involved in the reverse transport of cholesterol. The ABC proteins are involved in the reverse transport of cholesterol. The ABC proteins are involved in the reverse transport of cholesterol, in membrane transport of lipophilic conjecture, in particular inflammation mediating substance such as prostaglandins and prostacyclins, or in any pathology whose candidate conforms and prostacyclins are involved in the manufacture of a medicament intended for prevention of arteriosclerosis in various forms. The ABCA5, ABCA6, ABCA9 and ABCA10 genes are located to chromosome 17, more specifically to the 17q24 locus.
